International Olympiad in Informatics 2015

26th July - 2nd August 2015

Almaty, Kazakhstan

Day 1

teams

Language: en-LKA

Teams

There is a class of N students, numbered 0 through $N - 1$. Every day the teacher of the class has some projects for the students. Each project has to be completed by a team of students within the same day. The projects may have various difficulty. For each project, the teacher knows the exact size of a team that should work on it.

Different students may prefer different team sizes. More precisely, student i can only be assigned to a team of size between $A[i]$ and $B[i]$ inclusive. On each day, a student may be assigned to at most one team. Some students might not be assigned to any teams. Each team will work on a single project.

The teacher has already chosen the projects for each of the next Q days. For each of these days, determine whether it is possible to assign students to teams so that there is one team working on each project.

(ගුරුතුමා ඊලඟ දින Q සඳහා වයපෘති සැලසුම් කර ඇත   එම සෑම දිනයකටම, අදාල වයපෘති සියල්ලම සඳහා සිසු කණ්ඩායම් සැදිය හැකිද යන්න තීරණය කල යුතුය   )

Example

Suppose there are $N = 4$ students and $Q = 2$ days. The students' constraints on team sizes are given in the table below.

student	0	1	2	3
A	1	2	2	2
B	2	3	3	4

On the first day there are $M = 2$ projects. The required team sizes are $K[0] = 1$ and $K[1] = 3$. These two teams can be formed by assigning student 0 to a team of size 1 and the remaining three students to a team of size 3.

On the second day there are $M = 2$ projects again, but this time the required team sizes are $K[0] = 1$ and $K[1] = 1$. In this case it is not possible to form the teams, as there is only one student who can be in a team of size 1.

Task

You are given the description of all students: N, A, and B, as well as a sequence of Q questions — one about each day. Each question consists of the number M of projects on that day and a sequence K of length M containing the required team sizes. For each question, your program must return whether it is possible to form all the teams.

You need to implement the functions init and can:

- init(N, A, B) — The grader will call this function first and exactly once.

- N: the number of students.

- A: an array of length N: A[i] is the minimum team size for student i.

- B: an array of length N: B[i] is the maximum team size for student i.

- The function has no return value.

- You may assume that $1 \leq$ A[i] $\leq$ B[i] $\leq$ N for each $i = 0, \ldots,$ N-1.

- can(M, K) — After calling init once, the grader will call this function Q times in a row, once for each day.

  - M: the number of projects for this day.

  - K: an array of length M containing the required team size for each of these projects.

  - The function should return 1 if it is possible to form all the required teams and 0 otherwise.

  - You may assume that $1 \leq$ M$\leq N$, and that for each $i = 0, \ldots,$ M-1 we have $1 \leq$ K[i] $\leq N$. Note that the sum of all K[i] may exceed N.

Subtasks

Let us denote by S the sum of values of M in all calls to can(M, K).

subtask	points	N	Q	Additional Constraints
1	21	$1 \leq N \leq 100$	$1 \leq Q \leq 100$	none
2	13	$1 \leq N \leq 100,000$	$Q = 1$	none
3	43	$1 \leq N \leq 100,000$	$1 \leq Q \leq 100,000$	$S \leq 100,000$
4	23	$1 \leq N \leq 500,000$	$1 \leq Q \leq 200,000$	$S \leq 200,000$

Sample grader

The sample grader reads the input in the following format:

- line 1: N

- lines 2, …, N + 1: A[i] B[i]

- line N + 2: Q

- lines N + 3, …, N + Q + 2: M K[0] K[1] … K[M − 1]

For each question, the sample grader prints the return value of can.
